AAN: New MS Theory Still Needs More Study

By Michael Smith, North American Correspondent, MedPage Today
Published: April 16, 2010

RATE THIS REPORT

TORONTO -- This special InFocus™ report explores the novel theory that multiple sclerosis is at least partly a matter of abnormal vasculature in the neck, a theory that has generated a storm of attention here at the American Academy of Neurology meeting.

Paolo Zamboni, MD, the man whose findings sparked the intense interest, sat down with MedPage Today correspondent Michael Smith to explain the theory, discuss what research still needs to be done, and suggest what doctors should tell their patients while studies are under way.

MedPage Today provides daily, peer-reviewed medical news articles, written specifically for the clinician.

Why register?

1. While we cover most medical specialties, you can personalize the site to focus on your medical interests.
2. Know before your patients ask. Have quick access to evidence-based data, when patients print out what they found online and may be from questionable sources.
3. Optional breaking Medical News alerts. We NEVER sell, rent or otherwise share your personal data.
4. Have the option to participate in occasional paid surveys.
5. See article recommendations based on your specialty and declared interests.
6. Earn quick CME or CE credit for reading the news. Available on most articles.
7. It's Free

Current Survey

Past Surveys

Researchers recently suggested that altered blood levels of carbon dioxide and potassium may be partly responsible for the "near-death" experiences some patients have.

Do you think the popularly described near-death experience has a biological basis?

- Yes
